10.0 Firmware

10.1 PMBUS and EEPROM

There is a 8Kbyte EEPROM in power supply, communication with system via IIC bus.

10.2 PMBUS Communication

There is 3.3V voltage to supply the EEPROM and MCU's Vcc in power supply. The MCU and EEPROM in power supply can communication with system via PMBus1.2 protocol or IIC protocol bus. The power supply output terminal has two signal, one is SCL(clock bus),the other is SDA (data bus),they are bidirectional communication and can get a continuous signal bus. The supply voltage of bus is 3.3 ~ 5V, So SDA (data bus) and SCL (clock bus) needs to be pulled up a 4.7K resistor from system board's 3.3V or 5V voltage.

10.3 PMBUS Specification

Linear Data Format

The Linear Data Format is a two byte value with: An 11 bit, two's complement mantissa and A 5 bit, two's complement exponent (scaling factor). The format of the two data bytes is illustrated in below Figure

The relation between Y, N and the "real world" value is: $X = Y \cdot 2^N$

Where, as described above:

X is the "real world" value being communicated

Y is an 11 bit, two's complement integer; and

N is a 5 bit, two's complement integer.

Devices that use the Linear format must accept and be able to process any value of N.
